Project 3:
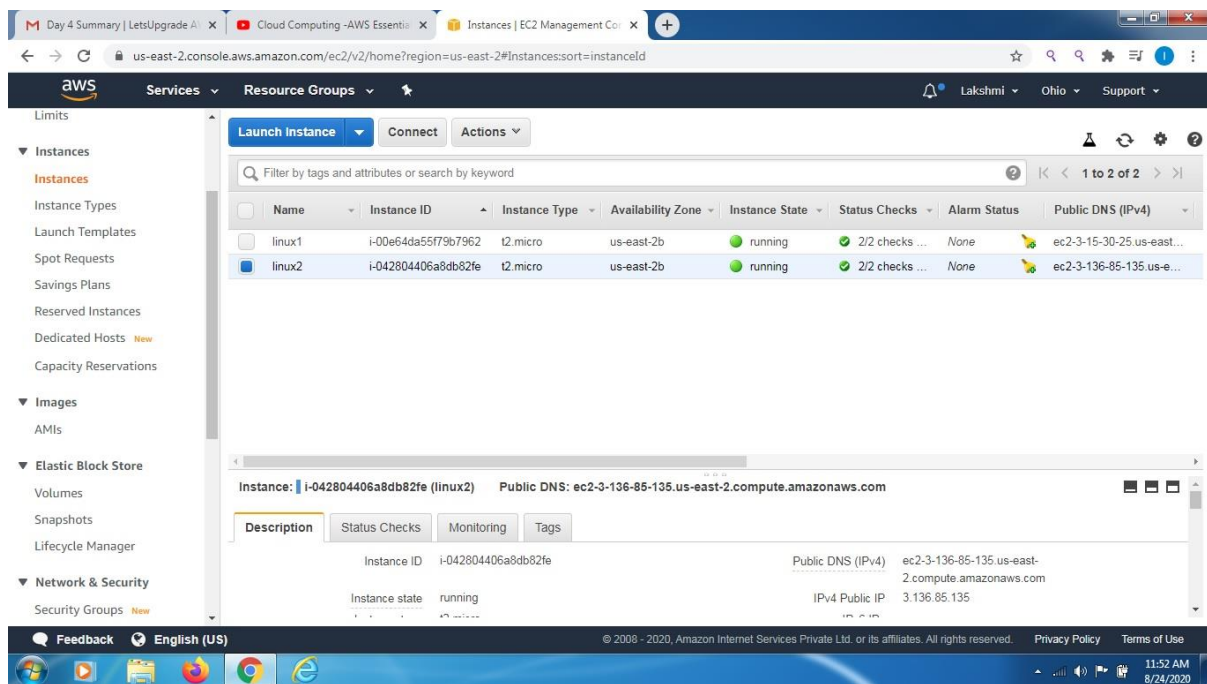

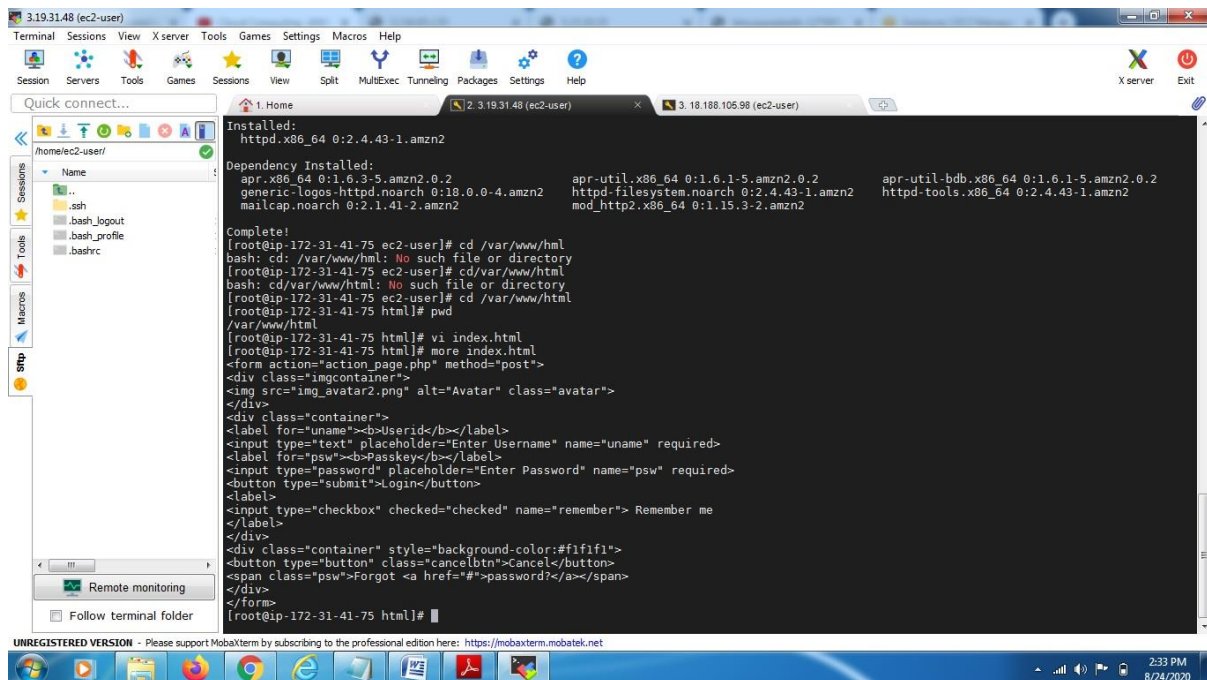

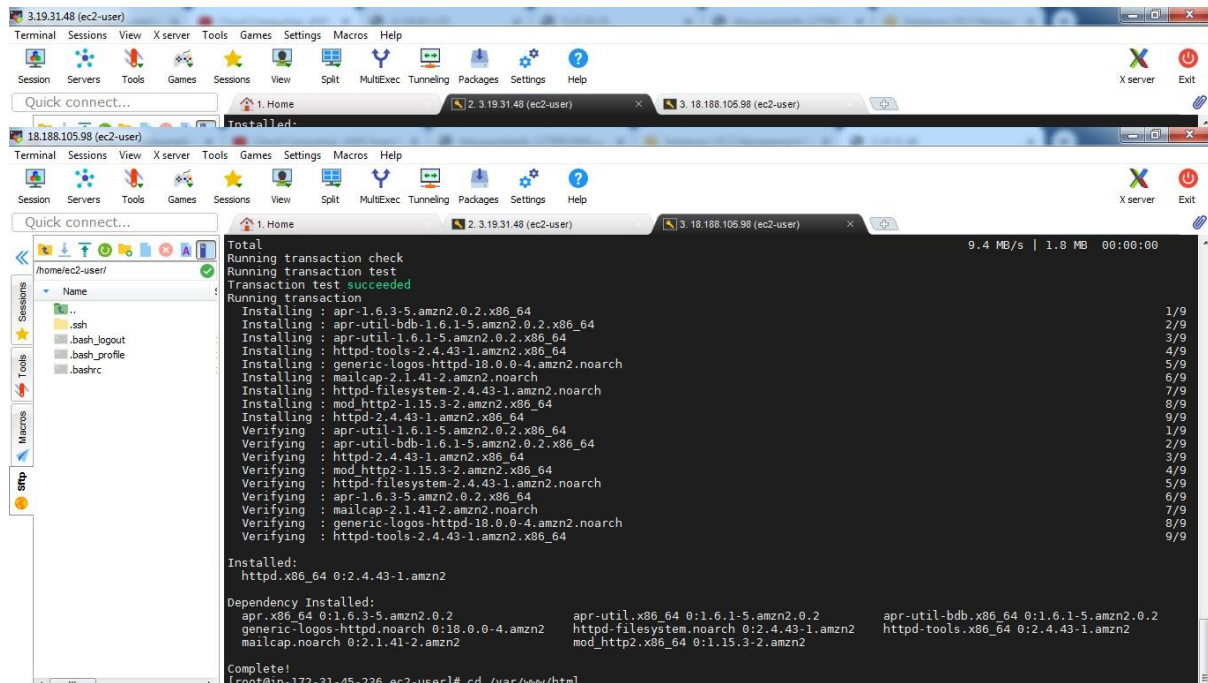

## Step 1: Create two linux instances,Use the first free linux AMI

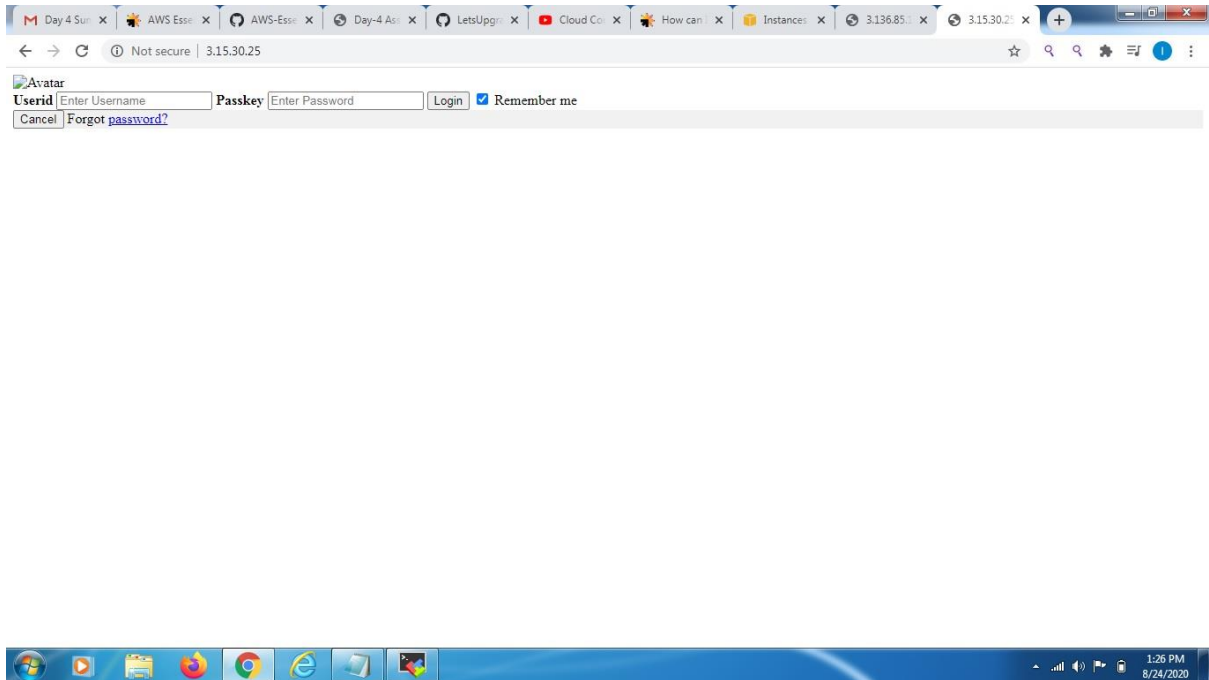

Step 2: Launch both instances using Mobaxterm
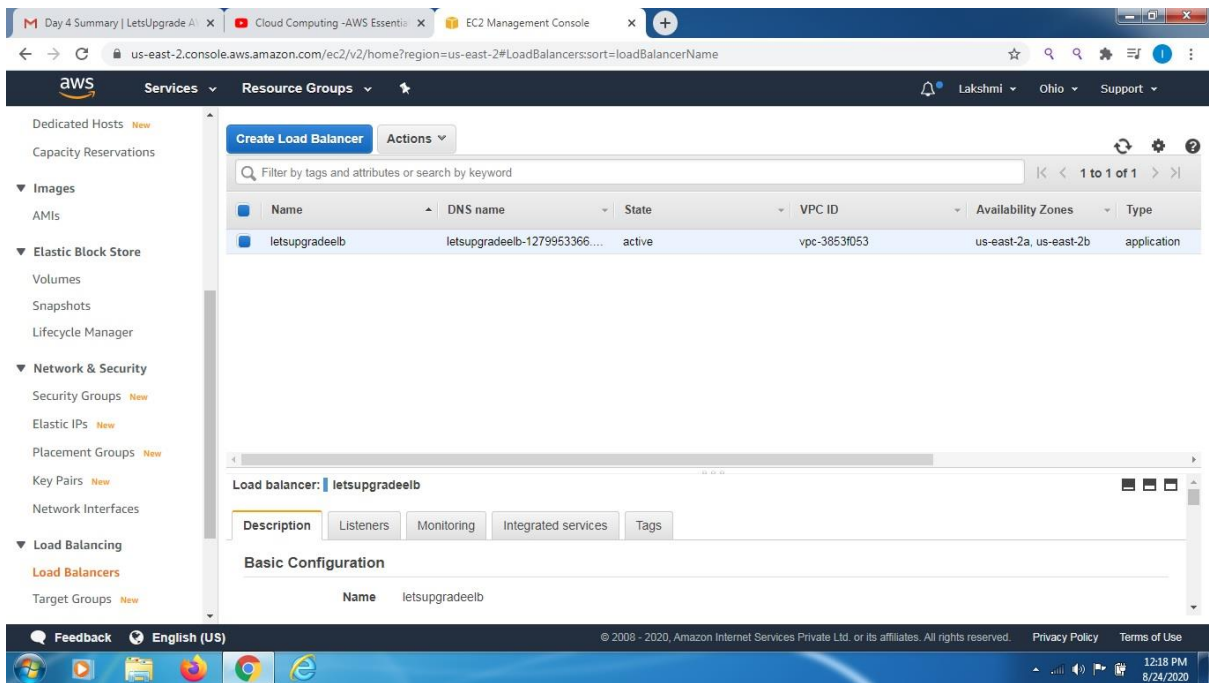

Step 3: Host html login webpage on both servers

Step4:Check if the application is deployed on both servers by copy pasting the public ip of the servers into the browser.
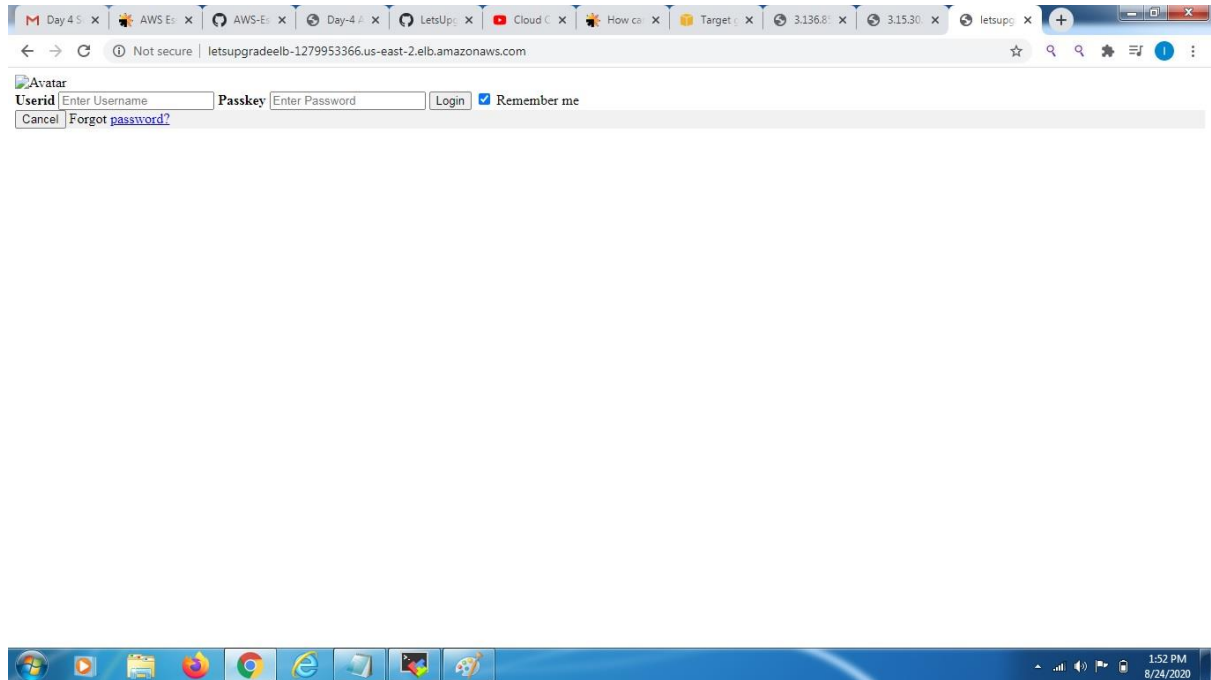

Step5:Create a application Load balancer with the above two instances as targets

Step6:Check the functioning of ELB

2.
